

# ERROR LOG

```
do {
    //prompt user to enter a number to pick what they want to d
    System.out.println("1. Show total in bank");
    System.out.println("2. Add a penny");
    System.out.println("3. Add a nickel");
    System.out.println("4. Add a dime");
    System.out.println("5. Add a quarter");
    System.out.println("6. Take money out of your bank");
    System.out.println("Enter 0 to quit");
    System.out.print("Enter your choice: ");

    //changes choice to the user input
    int choice = in.nextInt();

    //switch case for each choice
    switch (choice) {
```

Had to put int choice outside of the do while loop for it to run properly because there's a quit option that runs off of choice so I wanted the do while loop to end when the user picks the quit option but since choice existed only inside the do while loop at first it couldn't end when the user picked the quit option

```
int choice = 0;

do {
    //prompt user to enter a number to pick what they want to
    System.out.println("1. Show total in bank");
    System.out.println("2. Add a penny");
    System.out.println("3. Add a nickel");
    System.out.println("4. Add a dime");
    System.out.println("5. Add a quarter");
    System.out.println("6. Take money out of your bank");
    System.out.println("Enter 0 to quit");
    System.out.print("Enter your choice: ");

    //changes choice to the user input
    choice = in.nextInt();

    //switch case for each choice
    switch (choice) {
```

Improved version ^^
